

Crisis management and emergency credentialing gained significant attention during public health emergencies such as the COVID-19 pandemic. The lessons learned from these experiences underscore the need for healthcare organizations to develop and implement best practices for rapid credentialing processes that can adapt to emergent situations. Effective emergency credentialing ensures that qualified healthcare professionals can be deployed quickly to meet increased patient care demands while maintaining safety and quality standards. Revisiting the strategies and protocols implemented during past crises allows organizations to refine their approaches and enhance preparedness for future public health emergencies.

Objectives:

1. Identify and review key lessons learned from the 2020 pandemic regarding crisis management and emergency credentialing practices.
2. Assess best practices for rapid credentialing during public health emergencies, focusing on efficiency, compliance, and quality assurance.
3. Create a framework for developing and implementing emergency credentialing strategies to enhance organizational readiness for future crises.

Crisis Management and Emergency Credentialing
